

A Note to Our Readers:

This document was developed by the Prevention Strategies Subcommittee (PSS) of the Arizona Healthcare-Associated Infection (HAI) Advisory Committee in 2012. PSS is a multidisciplinary committee representing various healthcare disciplines working to define and categorize the strength of evidence for preventing healthcare-associated infections. Their work was guided by the best available evidence at the time this document was created. The toolkit documents reflect consensus on what the HAI Advisory Committee deems to be prudent practice.

The objectives of the PSS are directed at providing access to additional resources for healthcare facilities, creating a repository of information and constructing a toolkit of strategies that will assist facilities with preventing healthcare-associated infections.

The Prevention Strategies Subcommittee would like to acknowledge the following members who evaluated and assembled the documents:
